IMPORTANT NOTICE

This manual has been provided for the use of authorized Yamaha Retailers and their service personnel. It has been assumed that basic service procedures inherent to the industry, and more specifically Yamaha Products, are already known and understood by the users, and have therefore not been restated.

WARNING: Failure to follow appropriate service and safety procedures when servicing this product may result in personal injury, destruction of expensive components and failure of the product to perform as specified. For these reasons, we advise all Yamaha product owners that all service required should be performed by an authorized Yamaha Retailer or the appointed service representative.

IMPORTANT: The presentation or sale of this manual to any individual or firm does not constitute authorization, certification, recognition of any applicable technical capabilities, or establish a principle-agent relationship of any form.

The data provided is believed to be accurate and applicable to the unit(s) indicated on the cover. The research, engineering, and service departments of Yamaha are continually striving to improve Yamaha products. Modifications are, therefore, inevitable and changes in specification are subject to change without notice or obligation to retrofit. Should any discrepancy appear to exist, please contact the distributor's Service Division.

WARNING: Static discharges can destroy expensive components. Discharge any static electricity your body may have accumulated by grounding yourself to the ground buss in the unit (heavy gauge black wires connect to this buss).

IMPORTANT: Turn the unit OFF during disassembly and parts replacement. Recheck all work before you apply power to the unit.

■ SPECIFICATIONS

Keyboard	61 keys, C ₁ ~ C ₆
Sound Source	FM Tone Generator: 4 operators x 2 (A,B), 8 Algorithms
Simultaneous Note Output	Polyphonic: 8 notes (SINGLE), 4 notes (DUAL), 4 + 4 notes (SPLIT) Monophonic: 1 note (SINGLE, DUAL), 1 + 1 note (SPLIT)
Internal Memory	128 ROM voice memory 32 RAM voice memory 32 RAM performance memory
Controls	PITCH BEND WHEEL, MODULATION WHEEL, VOLUME, BALANCE, DATA ENTRY
Display	LCD (16 characters x 2 lines)
Connecting Terminals	OUTPUT MIX/A, OUTPUT B, PHONES, CASSETTE
Control Terminals	FOOTSWITCH (SUSTAIN, PORTAMENTO), FOOT CONTROLLER (VOLUME), MIDI (IN, OUT, THRU)
Dimensions/Weight	909 (W) x 82 (H) x 270 (D) mm (35.8" x 3.2" x 10.6") 8 kg (17.6 lbs)
Power Requirements	U.S. & Canadian Models: 120 V, 50/60 Hz General Models: 220 ~ 240 V, 50 Hz
Power Consumption	7 W
Standard Accessories	Music Stand, Cassette Cable
Optional Accessories	FC7 Foot Controller, FC4 or FC5 Footswitch, BC1 Breath Controller, LC-21S or SC-21 Carrying Case, LG-21 Stand, MIDI-03 or MIDI-15 MIDI Cable

■ TEST PROGRAMS

NOTE:

When the test program is executed, data in the performance memory will be initialized. Please write down the data to the performance data table before executing the program.

BEFORE ENTERING THE TEST MODE OF THE DX21, IT IS RECOMMENDED THAT YOU READ THROUGH THE TEST PROGRAM PROCEDURES... TEST 2 REQUIRES THE CONNECTION OF EXTERNAL DEVICES AND IT MAY HELP TO MAKE THE CONNECTIONS AND ADJUSTMENTS OF THIS TEST PRIOR TO ENTERING THE TEST MODE.

Test Mode Entry Procedure

To enter the internal test mode of the DX21, turn the power switch on while depressing the voice buttons **[1]** and **[2]** on the side A. Release buttons **[1]** and **[2]** once characters are displayed on the LCD. The unit will then display the ROM version message and automatically go to the first test or check.

TEST 1: ROM version message and level check

After initiating the Test Mode, the unit displays the message shown below.

V1. 2 05-Mar-85
Check Level

The first line of the LCD display indicates the ROM version number (V1. 2) and the date of that version. The second line of the display indicates that the unit is in the Level Verification Mode. Sine waves of 440Hz are output from each output jack when the volume is at its maximum level. The table shown below has the necessary information to check or verify each output level.

Output Jack	Level	Load
OUT A, B	-22dBm	10K
PHONES R, L	-13dBm	47

Before proceeding to the TEST 2, please read the instructions of that test. After reviewing the test procedure, depress the **[+1]** button to initiate the test.

TEST 2: Check of RAM, MIDI I/O, and Cassette Interface

Before initiating this test make the following connections as indicated below:

1. Connect MIDI IN and OUT with a MIDI cable.
2. Connect the cassette OUT jack to the input of an amplifier and connect the output of the amplifier to the cassette IN jack.

SPECIAL INSTRUCTIONS:

*A mixer or stereo cassette deck can be used as this amplifier stage. This amplifier is essentially inserted in the cassette OUT and IN path. The mixer or stereo cassette deck (in the REC/PAUSE mode) must be adjusted to have a gain of approximately 10dB.

This gain adjustment should be made before entering the Test Mode. To make this gain adjustment access the CASSETTE SAVE function of the DX21 and initiate the SAVE function by depressing the **[+1]** button twice. The Voice information of the DX21 is then transmitted from the Cassette OUT jack and has an approximate level of -28dB. Therefore, connect a level meter to the output of the amplifier stage and adjust the output level to approximately -18dB (a 10dB gain). Now the amplifier gain is adjusted to perform the Cassette OUT/IN test.

When you initiate TEST 2 by depressing the **[+1]** button, this test automatically executes the RAM, MIDI I/O, and cassette OUT/IN interface checks. If no ERRORS are detected then the test routine automatically sequences to TEST 3, the LCD Test.

If the RAM is bad the LCD display will indicate which IC is bad, providing that the malfunctioning RAM IC does not cause a system operation problem. If there is a malfunction of the MIDI OUTPUT or INPUT, the LCD display indicates ERROR MIDI! Also, it should be noted that if the MIDI test was checked by another technician the correct MIDI data may already be stored in the MIDI BUFFER. Therefore, if you initiate the MIDI test with no MIDI cable plugged in it will still pass the test with no ERROR. You can CLEAR the MIDI buffer by connect the cable and play the keyboard in the normal operating mode. This procedure will store different MIDI data into the MIDI BUFFER.

If the cassette OUTPUT, INPUT or the inserted amplifier stage malfunctions, the LCD display will indicate ERROR CASS.!

TEST 3: LCD Check

This test checks the LCD display. All dots on the LCD should flash. Verify that each dot flashes.

Before proceeding on to TEST 4, the A/D and foot-switch test, connect the BC-1, FC-7, and two FC-4s to all BREATH, VOLUME, SUSTAIN, and PORTAMENTO jacks. Then depress **[+1]** for approximately one second to proceed to TEST 4.

TEST 4: A/D and Footswitch check

For this test you operate the controls as indicated by the LCD display. Once the control is operated throughout its range LCD display will indicate the next control that to be checked. If a control or controller is malfunctioning then the test will not advance to the next control. It should also be noted that all controls and controllers must be checked for the Test Routine continue on to the next test. This test checks the following controls and controllers listed below:

1. The PITCH BEND control
2. The MOD. WHEEL control
3. The DATA ENTRY control
4. The FOOT VOL. controller
5. The BREATH controller
6. The SUSTAIN footswitch
7. The PORTAMENTO footswitch

The test routine automatically increments to the TEST 5, once all checks have been completed.

TEST 5: Keyboard check

Test 5 checks the keyboard contacts. The LCD displays the keys to be depressed and once the key is depressed and released the LCD will indicate the next key to be depressed. No error message occurs when a key contact is bad or a key is depressed in error. Once all key contacts have been verified by depressing and releasing the appropriate keys, the Test Routine advances to TEST 6, the Panel Switch check.

TEST 6: Panel Switch check

For this test, press the switch indicated by the LCD display. The numbering order of the panel switch sequence is shown below.

After the panel switch test has been completed, the test routine automatically exits the Test Mode and the unit returns to its normal operating mode.

■ BASIC CIRCUIT OPERATIONS

1. The Main Clock Circuit

The clock generation circuit for the CPU and sound generation, generates a signal having a frequency of 7.15909MHz. The signal of 7.15090MHz is applied to the EXTAL pin of the CPU, and divided by a factor of 4 inside the CPU to create the system clock.

A signal having a frequency of 3.58MHz is used for sound generation.

2. The Sub-Clock Circuit

This clock circuit generates a signal of 500kHz for A/D conversion and the MIDI clock. The 500kHz clock signals are applied to pin 22 of the CPU, which in turn is divided by a factor of 16 inside the CPU to create the 31.25kHz MIDI clock.

3. The Reset Circuit

A reset signal is generated an RC network and Schmitt Trigger inverter IC. A reset IC is used to short any remaining voltage of the 10 microfarad charging capacitor to ground on power-up. Then the reset IC goes to a high impedance state to allow the capacitor to charge via a resistor connected to the +5V supply. Therefore, initially the reset signal is a logic "LOW" level until the capacitor reaches the threshold of the Schmitt Trigger Inverter ICs and then the reset signal switches to a "HIGH" logic level. The reset signal is also fed to two transistors. One transistor controls the Battery Back-Up circuit and the other control the CHIP SELECT 2 signal for the RAM ICs. The CHIP SELECT 2 or CE2 signals disables the RAM ICs so they will not be selected. This eliminates the possibility of the RAM ICs being accessed and accidentally written to.

4. The CPU, ROM and RAM

- The CPU with clock input of 7.15909MHz, operates with a system clock of approximately 1.8MHz. The access time for the ROM, RAM, and other components connected to the bus must be faster as the read/write pulse width is approximately 260nS.
- The ROM is allocated from addresses \$8000 to \$FFFF of the memory, with \$8000 to \$A480 being the area for the 128 voice data, and \$A480 to \$FFFD being the program area. The use of two 128K bytes ROM is possible. In this case, jumper *1 is moved to *2, and IC36 is installed.
- The RAM is allocated from addresses \$1000 to \$27FF of the memory with the area from \$1000 to \$191F used as the voice memory area, and the area from \$1920 and above is used for the various stacks and registers. Furthermore, the entire area is memory backed up by a battery to enable the memory to be retained after the power is turned off.

5. The Address Map

The CPU addresses are as follows:

\$00	\$1F	Internal CPU registers and ports
\$20		A/D output port
\$22		A/D start
\$24		OPM
\$26		LCD
\$28, \$29		CHORUS ON-OFF
\$40 ~ \$FF		RAM in CPU
\$1000 ~ \$27EF		RAM
\$8000 ~ \$FFFF		ROM

6. The A/D Circuit

The A/D circuit uses an 8 bit 8 channel ADC IC. Five of the eight input channels are used. When a channel number and start pulse are received from CPU, conversion is performed for that channel. The CPU is notified of the completed conversion when it receives the EOC signal from the ADC IC. The CPU outputs the OE signal after detection of EOC, and data is fetched from the data bus.

7. The Sound Generation Circuit

This circuit consists of 4 function operator with 8 note capability. The FM tone generator or operator and the DAC, generate the FM tones based on data from the CPU. There are two channels for audio output, and different voices are possible on each channel.

8. The Chorus Circuit

This is a phase modulation circuit with a 128 stage BBD. The effect is turned on/off by the CPU.

9. The HP Circuit

This is an amplification circuit for the headphones which allows use of headphones having an impedance of 8 to 150 ohms.

10. The Switch Scan Circuit

The switch scan circuit is connected directly to the CPU and is capable of scanning 128 (8 x 16) switches. With the DX21, 61 Keyboard switches and 42 panel switches are scanned, for a total of 103 switches.

11. The MIDI circuit

The MIDI circuit is connected directly to the CPU and has IN, OUT, and THRU OUT terminals, and meets MIDI standards V1.0.

12. The Cassette Interface Circuit

The cassette interface circuit connected is also directly to the CPU and runs the cassette I/O at a rate of 1200 baud which is controlled by the CPU software.

■ TABLE OF IC PIN FUNCTIONS

YM2164 OPP

Pin No.	Pin Name	I/O	Function	Remarks
1	V _{ss}	—	GND	
2	$\overline{\text{IRQ}}$	—	IRQ output port	
3	$\overline{\text{IC}}$	I	"L" reset input (Active Low)	
4	A ₀	I	Internal register selection signal input	
5	$\overline{\text{WT}}$	I	Data write request input from CPU	
6	$\overline{\text{RD}}$	I	Data read request input from CPU	
7	$\overline{\text{CS}}$	I	Chip selection input	
8	$\overline{\text{CT1}}$	O	Filter characteristics switch or control signal output for voice synthesizing	
9	$\overline{\text{CT2}}$	O	"	
10	D ₀	I/O	3-state data bus I/O port	
11	V _{ss}	—	GND	
12	D ₁	I/O	} 3-state data I/O port	
13	D ₂	I/O		
14	D ₃	I/O		
15	D ₄	I/O	} Signal output for L/R separation	
16	D ₅	I/O		
17	D ₆	I/O		
18	D ₇	I/O		
19	SH2	O	} Signal output for L/R separation	
20	SH1	O		
21	S ₀	O		
22	V _{cc}	—	Power +5V	
23	ϕI	O	Clock output for DAC synchronization	
24	ϕM	I	CPU master clock input for synchronization with CPU	

YM3012 DAC

Pin No.	Pin Name	I/O	Function	Remarks
1	V _{cc}	—	+5V	
2	CLOCK	I	Timing clock input for synchronization with OPP	
3	GND	—	Digital GND	
4	DATA	I	Voice serial data input	
5	SAM 1	I	Data input for sampling (for L/R separation)	
6	SAM 2	I	" (")	
7	$\overline{\text{ICL}}$	I	Initial clear input	
8	GND	—	Analog GND	
9	CH 1	O	CH1 (L ch) analog signal output

11	COM	I	L/R Separation input	
12	To BUF	O	DAC Analog output	
13	Mid. Point	I	Reference voltage input of analog signal	
14	BC	O	Bias compensation	
15	RB	O	1/2 V _{cc} bias regulator output	
16	GND	—		

■ MIDI DATA FORMAT

1. Transmission Conditions

2. Transmission Data

All MIDI data is transmitted when the MIDI ON/OFF function is ON. The MIDI transmission channel is determined by the setting of the MIDI TRNS CH function.

2-1. CHANNEL INFORMATION

2-1-1. Channel Voice Message

(1) Key Off

Status	1000nnnn	n=channel no.
Note no.	0kkkkkkk	k=36(C1) ~ 96(C6)
Velocity	01000000	

(2) Key On

Status	1000nnnn	n=channel no.
Note no.	0kkkkkkk	k=36(C1) ~ 96(C6)
Velocity	01000000	

(3) Control Change

Status	1011nnnn	n=channel no.
Control no.	0ccccccc	
Control code	0vvvvvvvv	

a) Transmitted whether MIDI CH INFO is ON or OFF

Control no.	Control code.
C=64: Sustain sw.	V=0:OFF, 127:ON

b) Transmitted when MIDI CH INFO is ON

Control No.	Control code
C=1: modulation wheel	V=0~127
C=2: breath control	V=0~127
C=6: data entry slider	V=0~127
C=7: foot volume	V=0~127
C=65: portamento sw.	V=0:OFF, 127:ON

(4) Program Change

Status	1100nnnn	n=channel no.
Program no.	0ppppppp	p=0~31

This data is transmitted when a voice selector is pressed during the play mode, when MIDI CH INFO is ON and MIDI SYS INFO is OFF. Also transmitted when a performance selector is pressed in the performance mode.

(5) Pitch Bend

Status	1110nnnn	n=channel no.
Code (LSB)	0uuuuuuu	
Code (MSB)	0vvvvvvvv	

The transmitted data is as follows:

MSB	LSB	
00000000	00000000	Lowest value
01000000	00000000	Center value
01111111	01111110	Highest value

2-2. SYSTEM INFORMATION**2-2-1. System Real-time Message**

Active sensing	
Status	11111110

Transmitted once approximately every 200 milliseconds

2-2-2. System Exclusive Message

Transmitted only when MIDI SYS INFO is ON

(1) Parameter Change

Status	11110000	
ID no.	01000011	
Substatus/ch. no.	0001nnnn	n=channel no.
Parameter group no.	00010010	
Parameter no.	0ppppppp	
Data	0ddddddd	
EOX	11110111	

This data is transmitted when voice or function parameters are changed in the EDIT or FUNCTION modes. The voice parameters transmitted are those given in voice parameter table 5-2, and the function parameters transmitted are shown in function parameter table 5-3.

(2) 1 Voice Bulk Data

Status	11110000	
ID no.	01000011	
Substatus/ch. no.	0000nnnn	n=channel no.
Format no.	00000011	
Byte count	00000000	
Byte count	01011101	
Data	0ddddddd	} 93 bytes
	0ddddddd	
Checksum	0eeeeeee	
EOX	11110111	

The data for one voice is transmitted when a voice selector is pressed in the PLAY SINGLE mode. Data in the voice edit buffer is transmitted when a format no. f=3 dump request is received. The transmitted data is shown in voice parameter table 5-2. The checksum is the lowest 7 bits of the two's complement sum of all data bytes (the same applies below).

(3) 32 Voice Bulk Data

Status	11110000	
ID no.	01000011	
Substatus/ch. no.	0000nnnn	n=channel no.
Format no.	00000100	
Byte count	00100000	
Byte count	00000000	
Data	0ddddddd	} 4096 bytes
	0ddddddd	
Checksum	0eeeeeee	
EOX	11110111	

The data of all 32 voices in RAM memory will be transmitted if the YES (or BULK) key is pressed in response to the "MIDI Transmit?" display which appears when the BULK key is pressed in the FUNCTION mode. The data for all 32 voices will also be transmitted when a format no. f=4 dump request is received. The transmitted data is shown in voice data table 5-1. 55 bytes of 0's are added to the 73 bytes in this table, so 128 bytes are transmitted for each voice. 4096 bytes are therefore transmitted for all 32 voices.

3. Reception Conditions

4. Reception Data

All MIDI data is received when the MIDI ON/OFF function is ON. When a specific MIDI receive channel has been selected using the MIDI RECV CH function, and the OMNI mode is OFF, MIDI data will be received only on the specified channel. MIDI data will be received on all channels when the OMNI mode is ON.

4-1. CHANNEL INFORMATION

4-1-1. Channel Voice Message

(1) Key off

Status	1000nnnn	n=channel no.
Note no.	0kkkkkkk	k=0(C-2) ~ 127 (G8)
Velocity	0vvvvvvv	v is ignored

(2) Key On/Off

Status	1001nnnn	n=channel no.
Note no.	0kkkkkkk	k=0(C-2) ~ 127(G8)
Velocity	0vvvvvvv	v=0: key off v=1~127: key on

The key on note level will vary according to the received velocity value. The range of this instrument is C-1 to B6. If a higher or lower key number is received, it will be output within the range limits. For example, received C7 through B7 data will be output as notes in the C6 through B6 range.

(3) Control Change

Status	1011nnnn	n=channel no.
Control no.	0ccccccc	
Control code	0vvvvvvv	

a) Received whether MIDI CH INFO is ON or OFF

Control no.	Control code
C=64: Sustain sw.	V=0:OFF, 127:ON
Control no.	Control code
C=1: modulation wheel	V=0~127
C=2: breath control	V=0~127
C=5: portamento time	V=0~127
C=6: data entry slider	V=0~127
C=7: foot volume	V=0~127
C=65: portamento sw.	V=0:OFF, 127:ON

(4) Program Change

Status	1100nnnn	n=channel no.
Program no.	0ppppppp	

Received only when MIDI CH INFO is ON. If received during the PLAY or PERFORMANCE mode the voice or performance number will be changed accordingly. The lower five bits of the program no. contain the voice or performance number.

(5) Pitch Bend

Status	1110nnnn	n=channel no.
Code (LSB)	0uuuuuuu	
Code (MSB)	0vvvvvvv	

Function s only on MSB data:

MSB	
00000000	Lowest value
01000000	Center value
01111111	Highest value

4-1-2. Channel Mode Message

Status	1011nnnn	n=channel no.
	0ccccccc	
	0vvvvvvvv	

a) Recived whether MIDI CH INFO is ON or OFF

C=123 V=0 All notes OFF

b) Received only when MIDI CH INFO is ON

C=126 V=1 MONO mode ON
C=127 V=0 POLY mode ON

4-2. SYSTEM INFORMATION

4-2-1. System Real-Time Message

Active sensing

Status 11111110

Sensing begins when this code is received once. If status and data are not received within 300 milliseconds the MIDI receive buffer will be cleared and the currently output note will be turned OFF.

4-2-2. System Exclusive Message

(1) parameter Change (switch mode)

Status	11110000	
ID no.	01000011	
Substatus/ch. no.	0001nnnn	n=channel no.
Parameter group no.	00001000	
Switch no.	0mmmmmm	
Data	0ddddd	d=0:OFF, 1~127:ON
EOX	11110111	

All panel swithces are controlled. The switch numbers are arranged as shown in the illustration below. Receiced only when MIDI SYS INFO is ON.

(2) Parameter Change

The format is the same as the transmitted parameter change data. Received only when MIDI SYS INFO is ON. Permits changing voice and function parameters while the EDIT mode is active. It is also possible to change modes: PLAY, EDIT, etc. The parameter no. and data received are shown in voice parameter table 5-2 and function parameter table 5-3.

(3) 1 Voice Bulk Data

Received only when MIDI SYS INFO is ON. The format is the same as for the transmitted 1 voice bulk data. The 93 voice data bytes are read into the voice edit buffer, replacing the current voice data. The 93 received data bytes are shown in voice parameter table 5-2.

(4) 32 Voice Bulk Data

Received only when MIDI SYS INFO is ON. The format is the same as for the transmitted 32 voice bulk data. This data can be received only when the MEMOTY PROTECT function is OFF. The received voice data is stored in the 32 RAM voice memory locations. The "MIDI RECEIVED!!" display appears to confirm complete reception of 32 voice bulk data.

(5) Dump Request

Status	11110000	
ID no.	01000011	
Substatus/ch. no.	0010nnnn	n=channel no.
Format no.	0ffffff	f=3,4
EOX	11110111	

Received only when MIDI SYS INFO is ON. When received the bulk data corresponding to the received format code will be dumped via MIDI OUT.

f=3: 1 voice bulk data
f=4: 32 voice bulk data

5. System Exclusive Data
